DATA ANALYSIS PROJECT

ScoutAnalytics — Football Analytics and Scouting Tool

2025 – present

- End-to-end workflow, from Wyscout data exports to an interactive dashboard: controlled import in Python, SQLite database, analysis and visualisation.
- Supports any league and season exported from Wyscout; new data is added with a single command, including mid-season.
- Team and opponent analysis: playing identity, strengths and weaknesses, team comparison.
- Player analysis: profiles compared by position, performance contextualised by team playing style, similar players and search based on the club's criteria.
- Interactive dashboard built in JavaScript, in French, Spanish and English.
- Player and team analyses produced with the tool and published on LinkedIn for a professional audience.
- Case study: recruiting a centre-back in the Croatian Superleague, from the tactical need to SQL queries, a weighted ranking, video checks and a summary for the recruitment team.
